Personal Details

Birth Date: August 12, 1985

Nationality: Indian

Family Status: Married

Research Experience

Assistant Professor (Tenured) *2022–Onwards*
Institut de Recherche Interdisciplinaire en Biologie Humaine et Moléculaire (IRIBHM)
Université Libre de Bruxelles (ULB) ***Brussels, Belgium***

Project title: Regenerative and Stress Biology.

Research Group Leader *2019–2022*
Institut de Recherche Interdisciplinaire en Biologie Humaine et Moléculaire (IRIBHM)
Université Libre de Bruxelles (ULB) ***Brussels, Belgium***

Education / Training

Post-Doctoral Fellow *2014–2019*
DFG Center for Regenerative Therapies Dresden ***Dresden, Germany***

Research Advisor: Nikolay Ninov, Ph.D.
Project title: Cellular and Epigenetic Dynamics in β-cells during Development, Regeneration and Diabetes.

Post-Doctoral Fellow *2013–2014*
Max Planck Institute of Molecular Cell Biology and Genetics ***Dresden, Germany***

Research Advisor: Jochen Rink, Ph.D.
Project title: Live Imaging Stem Cell Dynamics during Growth and Regeneration.

PhD *2008–2013*
Duke University ***Durham, USA***

Research Advisor: Kenneth D. Poss, Ph.D.
Thesis Title: Cellular and Molecular Determinants of Zebrafish Fin Osteoblast Regeneration.

B. Tech., Biological Sciences and Bioengineering *2004–2008*
Indian Institute of Technology (IIT) ***Kanpur, India***
Grade: 8.7 / 10

Lab's Vision

The Singh Lab @ IRIBHM, ULB focusses on regenerative and stress biology. We are interested in

understanding the ability of organs to recover from injuries and stress. For example, we are able to heal a cut to our finger, even if it happens multiple times. Our blood regenerates after blood donation within a day or two. In ancient Greek mythology, Prometheus was sentenced to having half of his liver eaten by an eagle every day, but the liver would regenerate during the night – highlighting the almost infinite regenerative capacity of the liver. We are fascinated by such robustness in regenerative systems - which are a hallmark of a dynamic biological system.

To understand the robustness of biological systems, we explore two main themes: **plasticity and adaptation**.

For our experimental model, we use Zebrafish, which possess amazing regenerative abilities. It is able to recover from complete loss of bone cells or pancreatic β-cells. We utilize its super-natural regenerative ability to explore our themes, with the hope that the lessons we learn can be translated to improve outcomes of human injury.

Contribution to Science

1. **Cellular plasticity during regeneration**

   During my doctoral studies, we focused on the cellular source of bone-synthesizing osteoblast cells in the zebrafish fin. We developed a model for depleting the osteoblast population using a cell-specific and inducible ablation strategy. This revealed that the contribution of osteoblasts to bone and fin regeneration was redundant, and that the mesenchymal fibroblasts could contribute in their absence, demonstrating cellular plasticity during regeneration (1a).

   As a post-doctoral researcher, we embarked on understanding the plasticity in the pancreatic β-cell regeneration (1b). Zebrafish, can recover from complete β-cell destruction. In contrast, human β-cells do not recover after massive death, which, in turn, leads to Type 1 or Type 2 diabetes. For this, we carried out single-cell mRNA-Sequencing (scRNASeq) of the endocrine islets after β-cell ablation. This led to an intriguing observation that suggested plasticity within the endocrine population. We documented a new progenitor source for β-cells. Specifically, we observed a sub-population of the pancreatic δ-cells was capable of trans-differentiating into β-cells (1c).

2. **Adaptation to stress (starvation) response**

   A major driver of evolutionary selection is the adaptation to starvation as animals in the wild face uncertain food supply. Adaptation to periods of famine shape physiology in a variety of species: fatty liver in migratory birds, high blood sugar in seals and insulin resistance (IR) in hibernating bears. Work from our lab has demonstrated that the zebrafish liver accumulates lipid droplets in response to starvation (2a). Starvation-induced fatty liver, or hepatic steatosis, creates an energy reservoir that allows survival during long-term caloric deprivation. However, the fat accumulation in the liver damages the organ. In a collaborative project, we discovered that Mexican cavefish, a model of starvation resistance, evolved protection from starvation-induced liver damage through reduction of fatty acid uptake regulated by FATP2, a mechanism conserved through 400 million years of animal evolution (2b). We continue to investigate this "natural" mode of liver steatosis to uncover the mechanisms underlying its induction and resolution, and its relationship to liver atrophy. Other metabolic stressors, such as high-fat diet and alcohol both cause fatty liver, medically referred to as Metabolic-associated Fatty Liver (MAFL) and Alcoholic Fatty Liver (AFL), respectively. As steatosis is the first step towards liver disease, we are currently applying our findings to these clinically significant contexts.
